Coughs and Colds

Not to Be Neglected

Anyone will realize the seriousness

of neglecting a cold if he observes

results of such neglect among his

acquaintances. How often have you

card, "He caught cold, didn't do any-

hing for it and it turned into"-then

to dreaded disease is named.

crdinary colds yield to prompt treatment at the beginning. That is why every family should be supplied with a reliable cough medicine—one that will heal raw and inflamed surfaces, loosen the phiegm, allay irritation, ease the hoarseness and stop the tickling sensation in the throat that does not permit one to sleep.

Foley's Honey and Tar Cempound is invaluable for relief of coughs, colds, croup, whooping cough, tickling in throat, tightness or soreness, grippe or bronchial coughs. It contains no barneful ingredients. It is healing, soothing, efficient and pleasing.

YELLOW CREAM AND BUTTER

Show Popular Belief That Color Indicates Richness in Quality Mistaken.

The belief that a bright yellow color in milk means richness in quality is not true. Experiments conducted at the college of agriculture of the University of Missouri show that the change from the white cream and butter in winter to yellow cream and butter in spring and summer does not inity of chickens, making them objec dicate an increased fat percentage. The very highest colored milk that a cow can give may have the lowest fat percentage. Such a condition is found ing birth to a calf.

The explanation of the wide difference between the results of the exregard to the relation of color to richness lies in the cause of the natural yellow color of cream and butter. Itwas found that cows were not able to produce the yellow coloring matter for their cream and butter. The coloring matter must be derived from the feed. The yellow coloring matter of milk was found to be identical with a yelbow coloring matter that is widely distributed in plants and fresh grass. This coloring matter is called carotin. It takes its name from the carrot, where it is very abundant, and where it was first discovered by scientists

more than one hundred years ago. The difference in the color of cream and butter in winter and spring was found to be due to the fact that the winter feeds contain little or no carotin. No marked increase in the fat percentage accompanies the increase in color when foods rich in carotin are fed. It has been shown that the average cow gives a higher per cent of fat in its milk during the winter than in the spring and summer.

BUTTERMILK GOOD FOR CALF

Feeding Value Is Practically Same as That of Skim Milk-Some Danger of Tuberculosis.

Calves can be successfully raised with buttermilk instead of skim milk, says one farmer. The feeding value of buttermilk is practically the same as that of skim milk. There is some risk of contracting contagious diseases such as tuberculosis in feeding factory buttermilk, unless the buttermilk is from pasteurized cream. For this reason skim milk is more desirable. Buttermilk should always be fed as fresh as possible so that the degree of acidity is the same.

Buttermilk may be substituted for skim milk when the calf is three weeks old. The substitution should occupy a period of a week or ten days, so that the calf is at least a month old by the time the diet consists wholly of buttermilk.

Other feeds should be used with or clover hay has given the best re-
